

Hi, I'm Ericklis. I'm passionate about programming. In 2015 I traveled to Canada through the Win the World Program. In 2017 I started my building course because I thought construction was my dream. But I soon realized that my dream was to work with programming. So in 2020 I started my course in Information Systems and during the course I was able to take part in research projects that involved the IoT area in which a project was developed for an automated drinking fountain, and 3D printing where wheelchairs were printed for dogs with rear leg disabilities. I also took part in another project aimed at introducing 8th and 9th grade students to the world of programming and robotics. I also had an 8-month internship at SD Conecta where I had the opportunity to study for 3 months and then join the back-end team refactoring features to improve the user experience. I then spent two months on the startup's data team developing reports using PowerBI and Metabase, where I was able to collaborate with information required by the business and marketing teams in order to make improvement decisions for the product.
